

Morphotectonical Ensembles

2007

Morphotectonical Ensemble is an urban terrain, which has been developed historically. It is based on a unity of an area, which has been built under uniform social and economical conditions and building principles (morphotypes). A morphotectonical Ensemble is related to the concept of Urbantectonical Fractures. The term first appears in the draft of the doctoral thesis "The Expression of Cultural Functions in the City's Cultural Function" by Tomas S. Butkus in 2007.
